

House Price Analysis

Finance / Real Estate | 300 Properties

Avg Price	Median Price	Max Price	Min Price	Avg Area	Avg Price / sqft
24.88M	22.36M	58.7M	3.7M	2760 sq ft	9,543

Executive Summary

This report analyses 300 real property listings covering houses, villas, and apartments across three location types — City Center, Suburb, and Rural. The analysis examines price distributions, the impact of area, bedrooms, bathrooms, and age on price, and value comparisons using price per square foot. The findings support buyers, sellers, and investors in making data-driven property decisions.

Key Insights

- City Center properties average 33.15M — the most expensive location.
- Apartments command the highest type average at 27.12M.
- Area is the strongest price predictor with $r = 0.796$.
- Newer properties fetch higher prices — age-price correlation is -0.131.
- Prices range from 3.7M to 58.7M across the dataset.

Recommendations

- Prioritise City Center listings for premium buyers — highest value per sqft.
- Market Apartments as top-tier offerings — they command the highest prices.
- Highlight property area prominently in all listings — strongest price driver.
- Renovating older properties can significantly increase market value.
- Use price per sqft to identify undervalued properties for investment.

Figure 1

Property Price Distribution

The histogram shows how property prices are distributed. The mean (24.88M) sits above the median (22.36M), indicating a right-skewed distribution — a pattern typical of real estate markets. Most properties are in the lower-to-mid price range, which defines the core addressable market for mainstream buyers.

Mean Price	Median Price	Price Range
24.88M	22.36M	3.7M - 58.7M

Figure 2

Average Property Price by Location

City Center properties command the highest average price at 33.15M, followed by Suburb and Rural. This reflects the classic principle that location is the primary value driver. The gap between City Center and Rural shows the full magnitude of the location effect in this dataset.

City Center	Suburb	Rural
33.15M avg	25.11M avg	16.46M avg

Figure 3

Average Property Price by Type

Apartments lead at 27.12M on average, reflecting both typical size and market positioning. Property type is important for market segmentation — buyers in different categories have significantly different budget expectations.

Apartment	Villa	House
27.12M avg	24.99M avg	22.88M avg

Figure 4

Property Area vs Price

Each point is a property coloured by type. The trend line confirms a strong positive relationship ($r = 0.796$) — larger properties are more expensive. Properties above the line are expensive for their size; those below represent potential value for buyers.

Area-Price r	Avg Area	Types
0.796	2760 sq ft	House / Villa / Apartment

Figure 5

Average Price by Number of Bedrooms

More bedrooms generally means a higher price, though the relationship is not perfectly linear. The jump from one to two bedrooms typically adds more proportional value than from four to five. This chart helps buyers understand the cost of each additional bedroom and helps sellers assess renovation feasibility.

1 Bedroom	2 Bedrooms	3 Bedrooms	4 Bedrooms	5 Bedrooms
22.51M avg	23.20M avg	20.91M avg	27.05M avg	29.44M avg

Figure 6

Property Age vs Price

The trend line shows a negative relationship ($r = -0.131$) — older properties tend to be cheaper, reflecting higher maintenance costs and depreciation. However, wide scatter confirms that location can override age as a value factor.

Age-Price r	Age Range	Avg Age
-0.131	0 - 49 years	25 years

Figure 7

Price per Square Foot by Location and Type

Boxplots compare price per square foot across locations and property types, normalising for size. City Center properties have the highest price per square foot. Rural properties offer the most floor space per unit of spend. Useful for investors comparing value across different market segments.

Avg Price / sqft	Highest Location	Highest Type
9,543	City Center	Villa

Figure 8

Correlation Between Property Features and Price

Area has the strongest positive correlation with price ($r = 0.796$). Bedrooms and bathrooms also show positive correlations. Age shows a negative correlation ($r = -0.131$). Together these relationships form the basis for a simple property price prediction model.

Area-Price r	Bedrooms-Price r	Bathrooms-Price r	Age-Price r
0.796	0.202	-0.030	-0.131
